

DOROT S100 Series

Advanced hydraulic solutions for optimal management
of liquid conveyance systems

 **Aquestia**

Directing the Flow

The direct sealing diaphragm valves were introduced to the world market for the first time by DOROT CONTROL VALVES at 1982. This valve is operated by the pressure of the pipeline and is used for various control applications in water supply, fire fighting, industrial, sewage and irrigation systems.

The only moving component is a reinforced diaphragm, which:

- Drip tight seals the liquid passage in the closed valve
- Allows free passage in the fully open valve with minimal obstruction to the flow line
- Throttles the flow passage in the modulating valve, as dictated by the pressure in the control chamber

The valve can be closed or modulated using the line pressure or an external separate pressure source that is equal or higher than the line pressure.

DOROT S-100 valves are made for easy, inline maintenance, executed also by unskilled personal using basic tools.

There are no shafts, bearings or seals that may corrode and there is no wear and tear by dirty abrasive water or chemicals.

Features and benefits

- Structural simplicity
- Superb design featuring exceptionally low pressure losses at high flow rates
- Can be used for regulating from no-flow to maximal flow with no need for additional throttling devices or by-pass valves
- For natural liquids, sea water and industrial effluents
- A wide selection of materials, coating and diaphragm types
- All valve models fit a wide variety of control applications using DOROT pilot valves

Principle of operation

3-way control system

The main valve is controlled by a manually, electrically or pressure actuated selector that:

- 1 Introduces the upstream pressure or an external pressure source to the valve's control chamber, thus pressing the valve diaphragm from top to a closed position.
- 2 Opens the valve by relieving the pressure from the control chamber and enabling the internal pressure in the line to push the valve diaphragm up and creating an unrestricted, full flow passage.
- 3 Shuts all passages to and from the control chamber, thus keeping the main valve in a fixed position. This position does not exist in devices used for ON/OFF control applications but is necessary in modulating valves.

2-way control system

A control system that consist of two restrictions:

- a. A fixed restriction at the upstream side of the control system (nozzle or needle valve)
- b. ON/OFF device (valve, relay or solenoid) or a modulating pilot valve with a larger passage than restriction 'a' that is installed at the downstream side of the control system. The main valve position is affected by the downstream pilot valve 'b' in the following ways:

- 1 When the pilot valve is closed, no water can be vented to the downstream and the main valve is closed by the upstream pressure, introduced into the valve control chamber through the restriction 'a'.
- 2 Opening the valve is enabled when the pilot 'b' is fully open and allows the drainage of pressure in the control chamber to the downstream. At this position the pressure in the control chamber nearly equals that of the downstream.
- 3 Throttling pilot valve 'b' so the flow running through it equals the flow entering through the restriction 'a', keeps a fixed volume of water in the control chamber and the main valve in a fixed position.

* Standard Diaphragm: Nylon Reinforced Natural Rubber.

Optional diaphragm materials such as NBR, Neoprene, EPDM etc. are available. These include potable-water compatible diaphragms for different pressure-ratings and valve-models other than the ones specified above.

** HP = High Pressure

*** Low pressure diaphragms are designed for open/close applications. For other applications please contact Aquestia application engineering.

Pressure Rating

Pressure rating of series 100 valves is body strength, connection standard and diaphragm type.

Pressure rating of valve body of standard models: 16 Bar / 250 psi.

Pressure rating of valve body of high pressure models: 25 Bar / 360 psi.

Connection standard is marked on the identification plate, assembled on the valve body.

Diaphragms operation pressure range is presented at the above table.
