

Pump Control Valves

Waterworks

Booster Pump Control Valve

Description

OCV 125-7, a booster pump control valve, shall function to eliminate the surges from starting and stopping the pump. The valve will be closed when the pump is started. It will open slowly, gradually introducing flow into the line. When the pump is signaled to stop, the pump control valve will close slowly while the pump continues to run. As the valve approaches the full closed position, the valve stem will trip a limit switch mounted on the valve. The limit switch will then shut down the pump. Opening and closing speeds are independently adjustable. In the event of a power failure while the pump is running, the valve will close quickly by means of its lift check feature to prevent back flow. The valve is primarily designed for use with centrifugal booster pumps and can also be used on well pumps with relatively shallow lifts where the pump design permits starting against a closed valve. Because of its lift check feature, the valve is ideally suited to those pumping applications where little or no back flow can be tolerated.

Features & Benefits

- Eliminates surges associated with starting & stopping the pump
- Pump starts against a closed valve that then gradually opens at a controlled rate
- Valve gradually closes at a controlled rate while pump continues to run
- Pump stops when valve is fully closed
- Integral lift check feature closes valve immediately on power
- Separate adjustable opening and closing speeds
- Can be maintained without removal from the line
- Factory tested

Typical Applications

Irrigation Systems

Municipal Distribution Systems

Pump Systems

Certification & Compliance

UL Water Quality / NSF 61-G & 372

NSF-ISO Quality System (9001)

American-Made: American Recovery & Reinvestment

ABS Type Approval

Factory Mutual Approved

CE (Conformité Européenne) Compliance

Industrial Plants

High-Rise/Commercial Buildings

Commercial Plumbing

Pump Control Valves

The OCV 125-7 is controlled by an electrical 3-way solenoid which is energized at pump start. This causes the valve to open at an adjustable controlled rate, smoothly transitioning flow into the system. At shut-down the solenoid is de-energized, causing the valve to close at an adjustable controlled rate while the pump (held on by the valve limit switch) continues to run. When the valve is fully closed, the pump is finally shut off.

In the event of power failure while the pump is running, the internal lift check feature will close immediately, thereby minimizing any

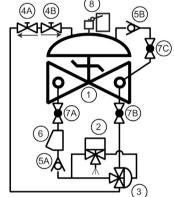

Components

The OCV 125-7 consists of the following components, arranged as shown on the schematic diagram:

- OCV 65SC Basic Valve Assembly with Lift Check
- 2 OCV 452 Three-Way Solenoid Pilot
- 3 OCV 3600 Three-Way Auxiliary Pilot
- OCV 141-3 Flow Control Valve 4
- 5 OCV 141-1 Check Valve
- OCV 159 Y-Strainer Protects pilot system from dirt/debris 6
- 7 OCV 141-4 Isolation Ball Valves
- OCV 31 Limit Switch Assembly

Pressure Table

End Connections	Ductile Iron	Steel/SST	Low-Lead Bronze					
Standard (Maximum Working Pressures at 100°F)								
Threaded	640 psi	640 psi	500 psi					
Grooved	300 psi	300 psi	300 psi					
150# Flanged	250 psi	285 psi	225 psi					
300# Flanged	640 psi	740 psi	500 psi					

Based on ANSI flange ratings.

Pump Control Valves

Flow Characteristics

 $DP = sg (Q/Cv \text{ or } Kv)^2$ where: Q = Flow rate in USGPM (Standard) or Q = Flow rate in cubic meters/sec (Metric)

Cv = Flow rate in USGPM @ 1 psi pressure drop (Standard) or

Kv = Flow rate in cubic meters/sec @ 1 bar pressure drop (Metric)

DP = Pressure drop in psi (Standard) or DP = Pressure drop in bar (Metric)

sg = Specific gravity of line fluid

Engineering Specifications

The booster pump control valve shall be a single-seated, line pressure operated, diaphragm actuated, pilot controlled valve. The valve shall seal by means of a corrosion-resistant seat and aresilient, rectangular seat disc. These, and other parts, shall be replaceable without removing the valve from the line. The stem of the main valve shall be guided top and bottom by integral bushings. Alignment of the body, bonnet and diaphragm assembly shall be by precision dowel pins. The diaphragm shall not be used as a seating surface, nor shall the pistons be used as an operating means. The pilot system shall be furnished complete and installed on the main valve. It shall include separate opening and closing speed controls, a Y-Type strainer, and isolation ball valves. The booster pump control valve shall be operationally and and hydrostatically tested prior to shipment. The main valve body and bonnet shall be ductile iron per ASTM A536, Grade 65-45-12. All ferrous surfaces shall be coated with with 4 mils of epoxy. Elastomers (diaphragms, resilient seats and o-rings) shall be EPDM. The speed controls, isolation ball valves, control line tubing, and the orifice plate shall be stainless steel. The solenoid coil shall be suitable for operation on 110-120 volts AC, 50-60Hz. The limit switch shall be equipped with SPDT contact rated at 15 amps at 125-480 VAC. Limit switch and solenoid enclosures shall be weatherproof per NEMA 4. The booster pump control valve shall be an OCV 125-7, as manufactured by OCV, Tulsa, OK, USA.
